Stage 1 Workflow Testing — Consumer Trend Discovery Agent

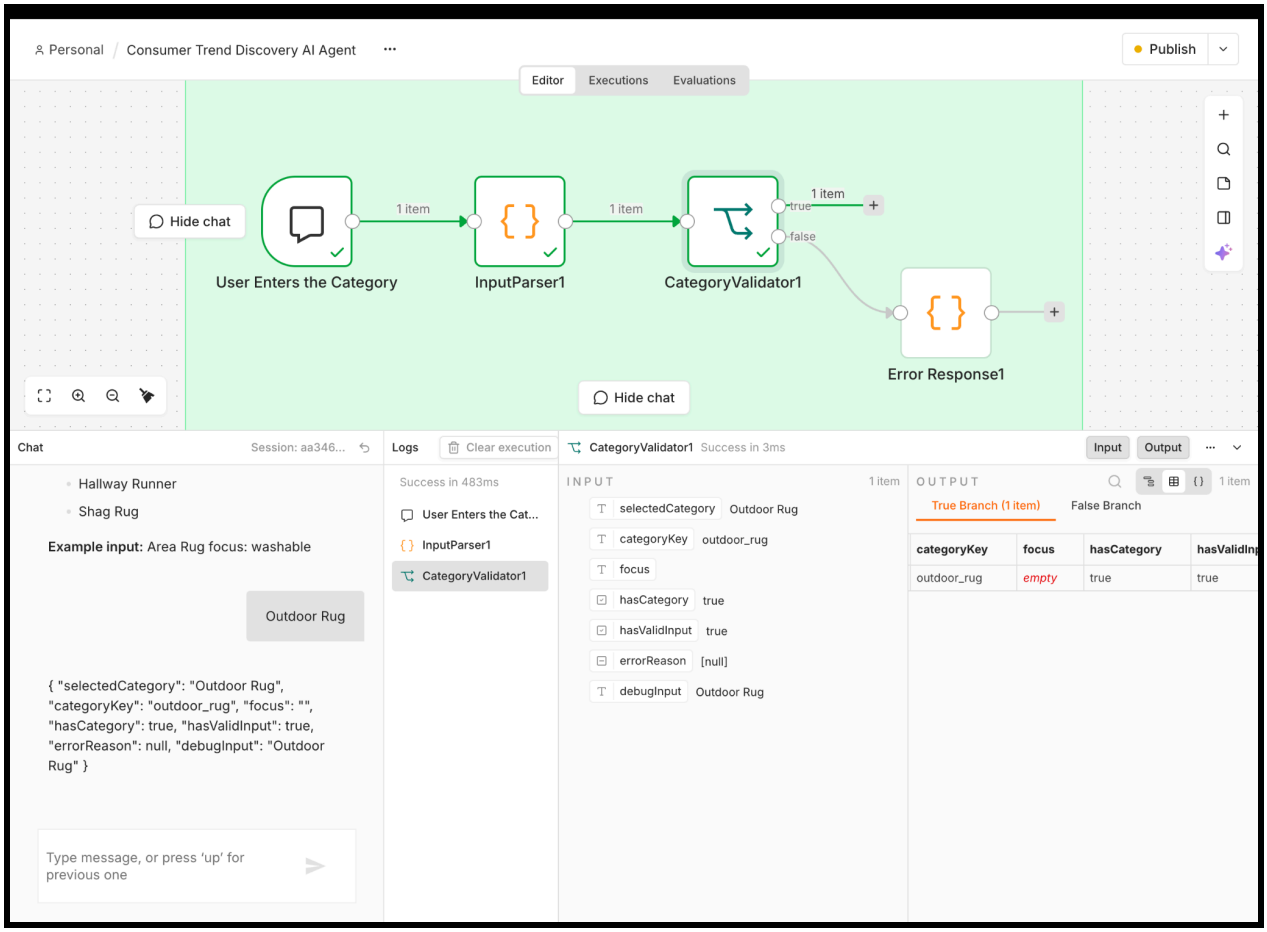

1. Workflow Tested with Valid Input

Test input: `Outdoor Rug`

Purpose: To verify that the workflow recognizes a supported product category and processes the request correctly.

Evidence: Screenshot of the workflow execution with valid input.

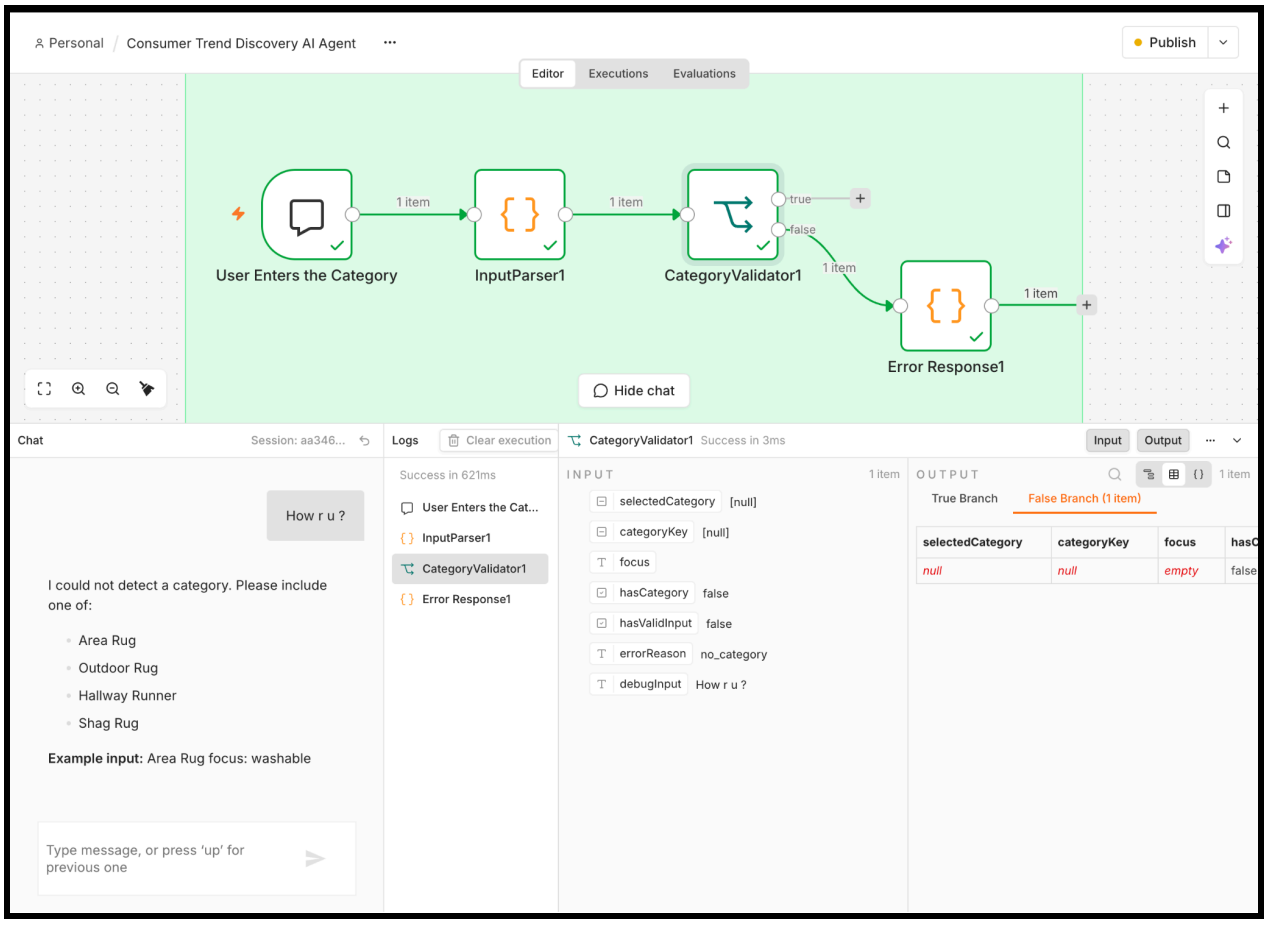

2. Workflow Tested with Invalid Input

Test input: `How r u`

Purpose: To verify how the workflow handles an input that does not match a supported product category.

Evidence: Screenshot of the workflow execution with invalid input.

Reflection

One thing that took extra time was converting the JavaScript code from the tutorial into Python, as I am using Python for this project. I had to understand the differences in syntax and logic to ensure the code worked correctly in my n8n workflow.

Current Status

Stage 1 workflow testing has been completed for both a valid input (`Outdoor Rug`) and an invalid input (`How r u`). Screenshots are included as evidence of the test executions.
